

A species is a group of similar organisms that can mate with each other and produce fertile offspring.

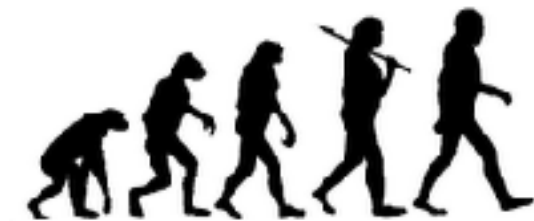

A fossil is the preserved remains or traces of an organism that lived in the past.

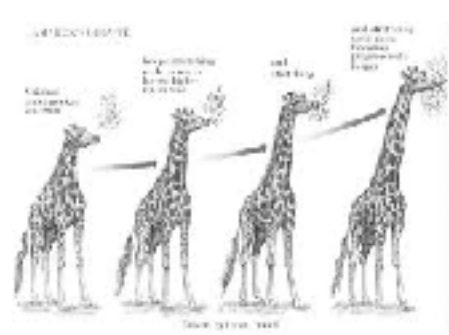

An adaptation is a trait that helps an organism survive and reproduce.

The gradual change in a species over time is called evolution.

Natural Selection is the process by which individuals that are better adapted to their environment are more likely to survive and reproduce than other members of the same species.

Any difference between individuals of the same species is called a variation.
